# Outline

- GFDL (limited development)
- COAMPS-TC (limited knowledge)
- HWRF (Focus of this presentation)
  - HWRF initial implementation, development 2008-2009
  - DTC Involvement 2009-present
  - Support to HWRF users
  - Recent R2O: does it meet our needs?
  - Revised HWRF code management and R2O protocols
  - Testing at DTC (past and future)
  - DTC facilitation of testing and transition, issues and challenges
  - Evaluation and verification

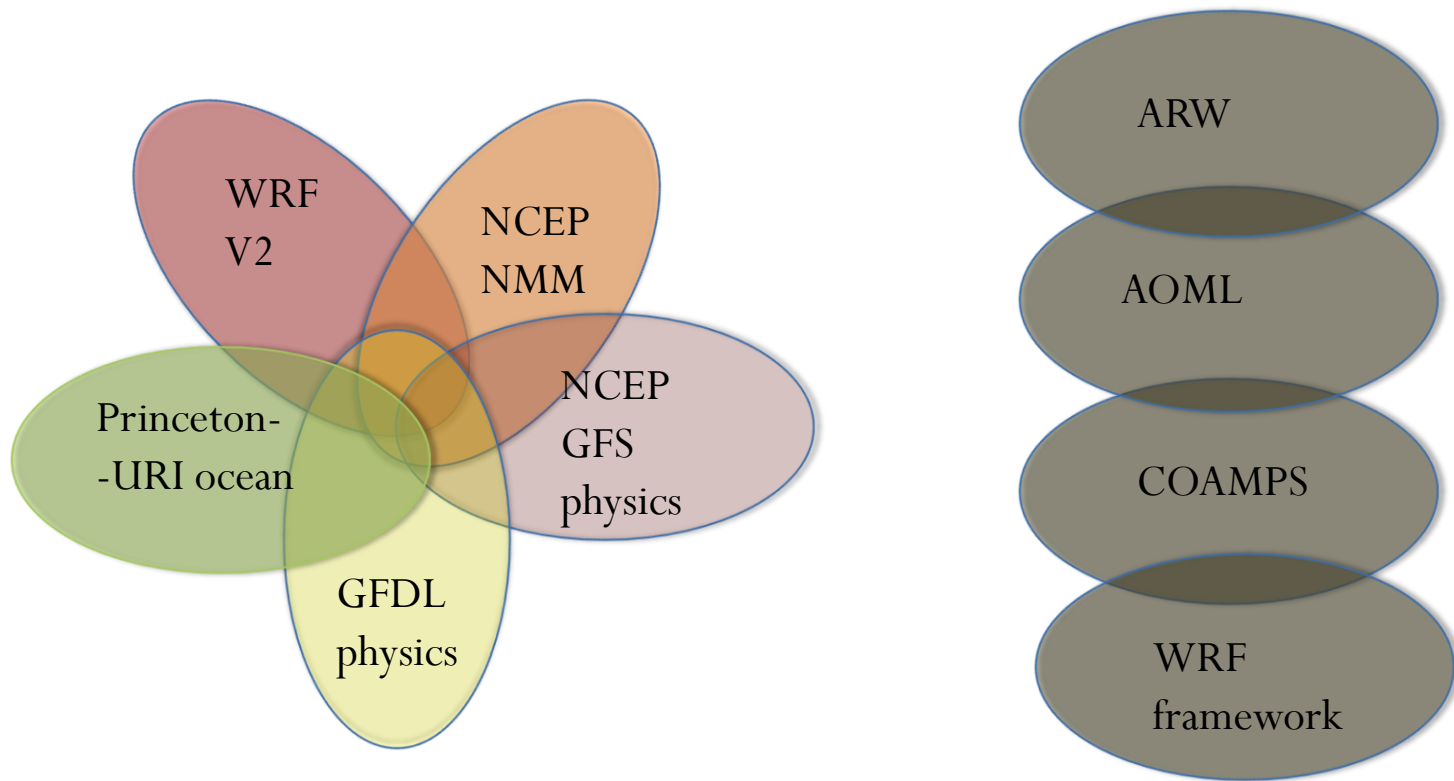

# 2007: HWRF Initial Implementation

- Developed 2004-2007 from a significant collaboration

# HWRF Subsequent development

- 2007-2009 HWRF remained somewhat isolated from collaborations

# 2009: Collaboration with DTC starts

- Recognition of importance of collaborations
- Decision to interface with community through DTC
  - Make operational code available to community
  - Manage code so that there is a single code base
  - Additional T&E to be performed by DTC

How is this being done and is it meeting our needs?

# Timeline of DTC work in Hurricanes

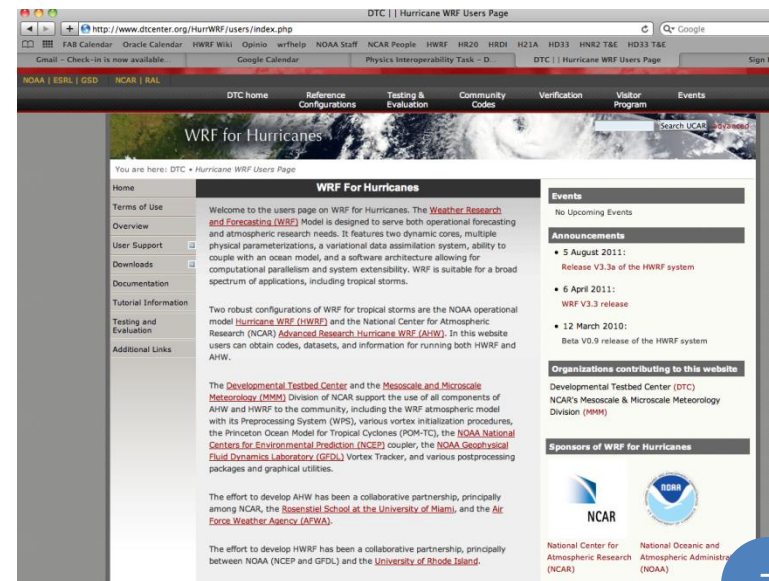

- 2009
  - Obtained HWRF codes
  - Established operational capability in existing repositories: WRF, WPS, WPP
  - Created community code repositories: POM, coupler, tracker, vortex initialization
- 2010
  - HWRF Beta-release, 1<sup>st</sup> HWRF Tutorial
  - Developed functionally-similar T&E suite
  - Testing for internal consistency, bug fixes
  - Operations: remain V2
- 2011
  - HWRF V3.3a release, 2<sup>nd</sup> HWRF Tutorial
  - Testing for internal consistency, bug fixes
  - Operations: upgraded to V3.2

**Good job of bringing community code and operational codes in sync**

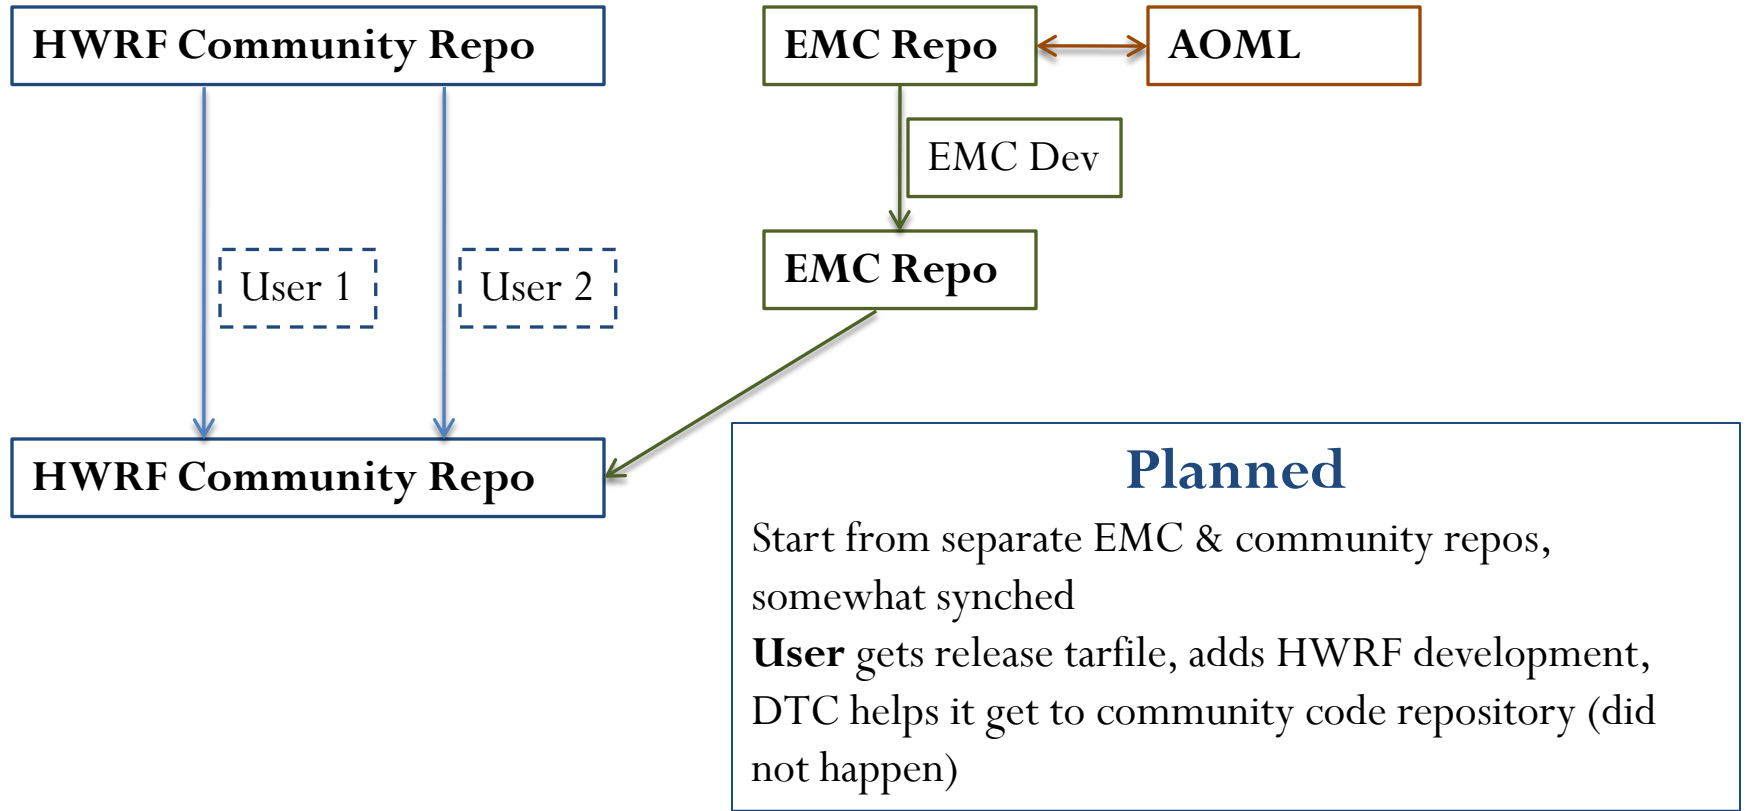

**With commitment, can keep them in sync as we go forward**

# HWRF User Support

- Code releases : HWRF V3.3a released 8/4/2011
  - All HWRF components: WRF, WPS, Vortex Initialization, GSI, POM, coupler, UPP, tracker
  - 270 registered users
- Documentation: Users Guide, Scientific Documentation
- Datasets
- Email helpdesk
  - Average 40 messages a month

# Recent R20

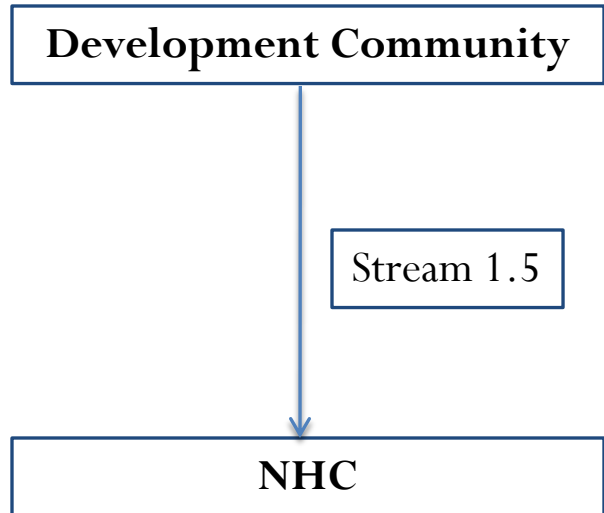

**EMC** uses its repository, DTC lifts code to include in community repositories

**AOML** gets code from EMC, develops, returns to EMC

# More recent R20 : HFIP Stream 1.5

## System

**HFIP** has large computational facility

**No NCEP/NCO involvement:**

Researchers/Developers deliver forecasts to NHC

R20 does not involve operational models

# Does current system meet our needs?

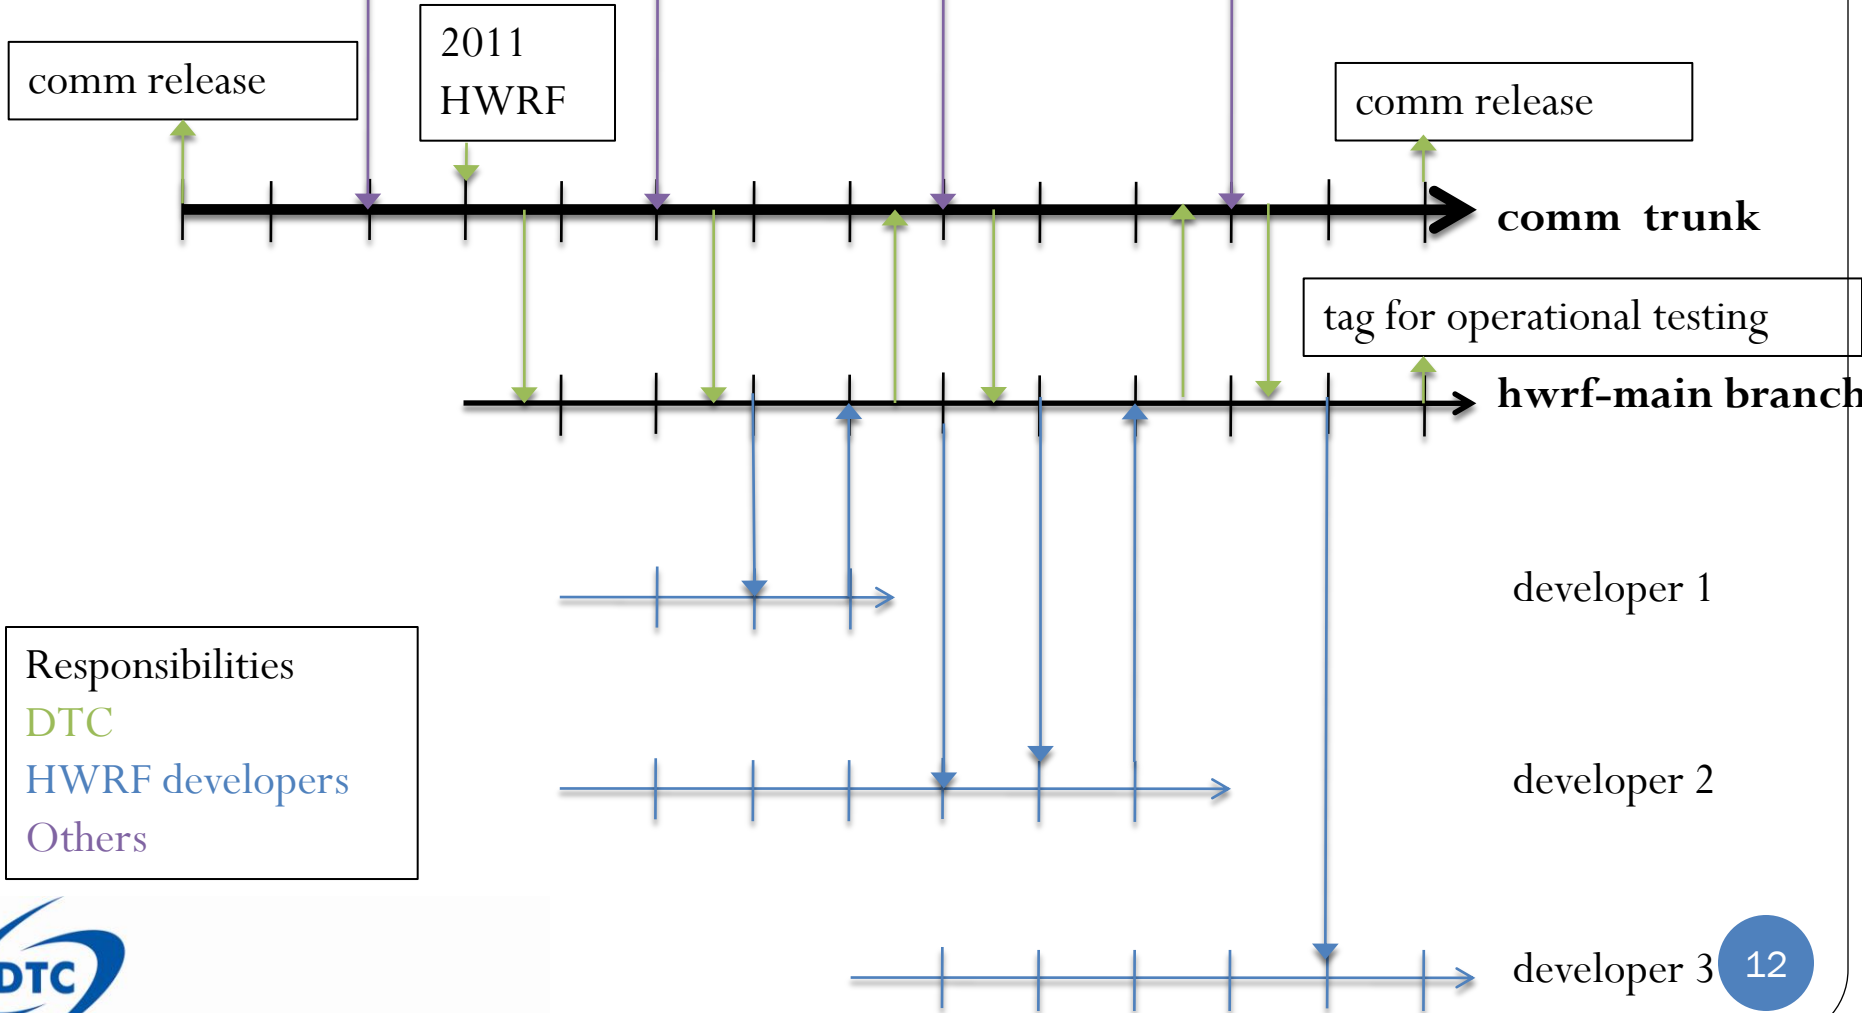

- Transferring code between EMC-DTC 10 repositories and back-forth EMC-AOML can introduce errors
  - And it has!
- Not sustainable for many developers
  - EMC cannot closely interact with all HFIP AO recipients
- No mechanism for developers to interact and share code
  - Example: How will URI test ocean model using developmental AOML/EMC 3-nest capability?
- Difficult for DTC to conduct relevant tests if developers only release code that is already tested
  - Example: How can DTC improve computational performance of 3-nest HWRF if code is yet to be transitioned to DTC?
- Important role for operational models (reliability etc.)
  - Stream 1.5 does not fill

# Revised HWRF Code Management

- DTC/EMC conducted about 20 h of meetings in 04/2011
- Decided to unify all development in community repositories
- Devised system of branches to support developers
- System undergoing implementation
- EMC requires all development to be conducted in this framework

# Code evolution in a HWRF component

Community Development

# Implementation of HWRF Code Management

## HWRF Code Management Procedures

A collaboration between DTC and EMC

Point of Contact Ligia Bernardet (ligia.bernardet@noaa.gov)

First Draft: May 10, 2011; Second draft: May 31, 2011; Third draft: July 15, 2011

### Goals

- Facilitate transfer of code between EMC, DTC, HWRF developers and HWRF users by improving the way code is shared and managed.
- Reduce the overhead in transferring code between multiple repositories.
- Minimize human error in the code management process.
- Install safeguards to protect integrity of the code.

**August 2011: 2011 HWRF operational capability is available**

- To users in public release
- To beta-test developers in SVN checkout

**Developers:** please contact DTC to obtain code and get your branch  
DTC will provide extensive support in using new system

Document is available at

[http://www.dtcenter.org/HurrWRF/users/others/index\\_links\\_HurrWRF.php](http://www.dtcenter.org/HurrWRF/users/others/index_links_HurrWRF.php)

# DTC Testing: functionally-similar T&E suite

- Pre-processing (including ability to ingest binary spectral GFS)
  - Cycled HWRF vortex initialization and relocation
  - GSI Data Assimilation
  - Coupled (POM + WRF) model
  - Post-processing
  - Tracking
  - NHC Verification & confidence intervals
  - Display
  - Archival
- 
- Uses NOAA Workflow Manager automation
  - Most runs done on jet; also available on bluefire IBM

# 2011 Operational Baseline Reference Configuration

## Goals

- Create benchmark for community
- Verify if 2011 Operational Baseline capability had been correctly ported to community codes and

## Outcome

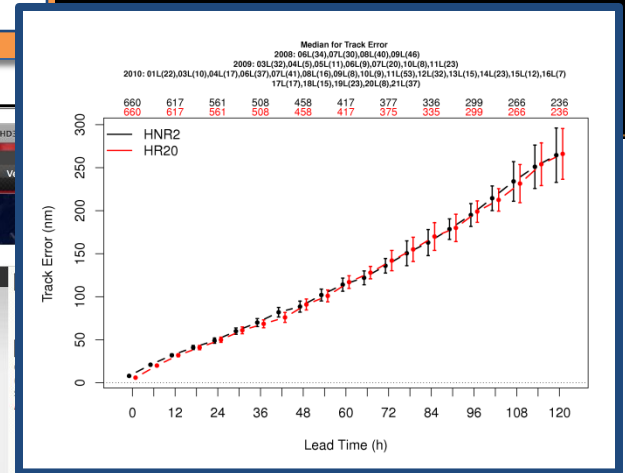

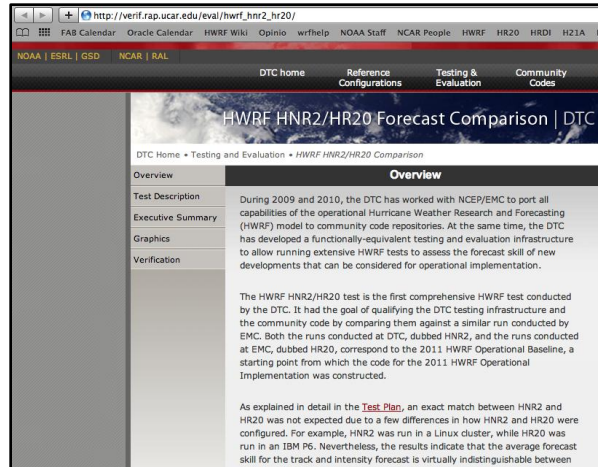

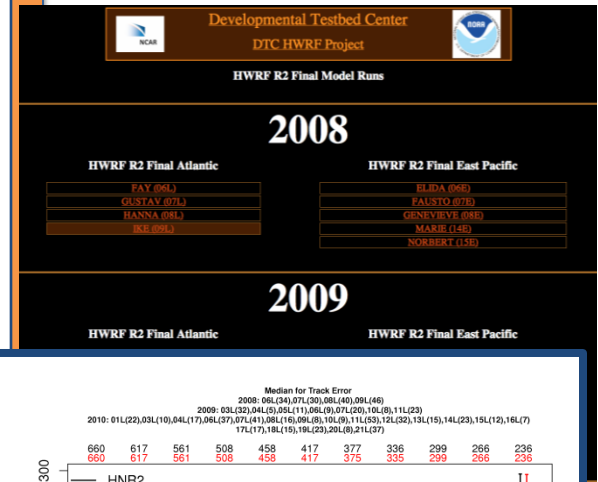

- Reference Configuration established
- Porting OK

### The Developmental Testbed Center HWRF 2011 Baseline Test Plan

Point of Contact: Ligia Bernardet  
December 15, 2010

#### Introduction

The DTC will be performing testing and evaluation for the Hurricane WRF system, known as HWRF (Gopalakrishnan et al. 2010). HWRF will be configured as close as possible to the operational HWRF model, employing the same domains, physics, coupling, and initialization procedures as the model used at the NOAA NCEP Central Operations and by the model developers at NCEP EMC. The configuration to be tested matches the 2011 HWRF Baseline, which is the configuration that served as control for all developments at EMC geared towards the 2011 operational implementation.

# 2011 Operational capability in community code

## Goal

Verify if 2011 operational capability had been correctly ported to community codes

## Outcome

Test identified issues which led to crisis-RFC

**The Developmental Testbed Center**  
**HWRF 2011 Operational Capability Test Plan**  
 Point of Contact: Ligia Bernardet  
 June 24, 2011

**1. Introduction**

The DTC will be performing testing and evaluation for the Hurricane WRF system, known as HWRF (Gopalakrishnan et al. 2011). HWRF will be configured as close as possible to the operational HWRF model, employing the same domains, physics, coupling, and initialization procedures as the model used at the NOAA NCEP Central Operations and by the model developers at NCEP/EMC. The configuration to be tested matches the 2011 Operational HWRF implemented at NCEP on May 15, 2011.

The HWRF System has the following components: WPS, prep\_hybrid (WRF preprocessor for input of GFS spectral data in native coordinates and binary format), vortex relocation and initialization, GSI 3D-Var, WRF model using a modified NMM dynamic core, POM, features-based ocean initialization, UPP, GFDL vortex tracker, GrADS-based graphics, and NHCvX. All acronyms are listed in Appendix C. HWRF is currently designed for use in the North Atlantic and North East Pacific basins. Atlantic forecasts are in coupled ocean-atmosphere mode, while Pacific forecasts use only the atmospheric model.

### HWRF HD33/H21A Forecast Comparison | DTC

DTC Home • Testing and Evaluation • HWRF HD33/H21A Comparison

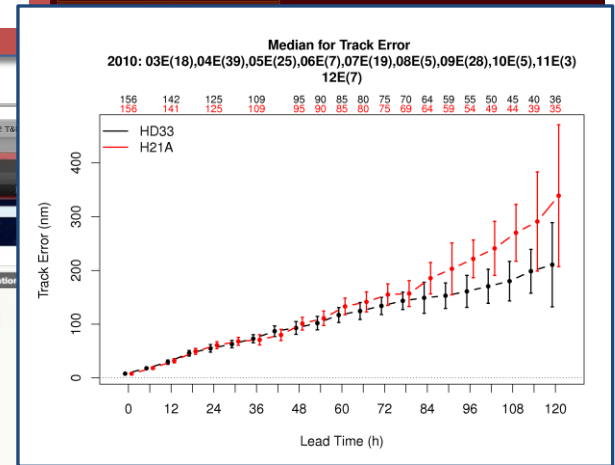

**Overview**

**Text Description**  
 The capabilities of the 2011 operational Hurricane Weather Research and Forecasting model (HWRF) have been ported to the Community HWRF code supported by the Developmental Testbed Center (DTC). A configuration of the community code (dubbed HD33) containing the 2011 operational capability was used to create retrospective forecasts for the entire 2010 season in the North Atlantic and Eastern North Pacific basins. The forecasts were compared against pre-implementation tests of the HWRF operational model run at NCEP/EMC (dubbed H21A).

**Graphics**  
 As explained in detail in the [Test Plan](#), a match between HD33 and H21A was not expected due to differences between the HD33 and H21A configurations. In particular, HD33 was run in a Linux cluster, while H21A was run in an IBM P6. Indeed, the results indicate that while the intensity forecasts are similar between HD33 and H21A, the skill in track forecasts are different, with HD33 displaying larger skill in the Pacific, while H21A has more skill in the Atlantic.

**Verification**  
 These results highlight the large sensitivity of the 2011 operational HWRF to the computational platform. Diagnostic studies subsequent to this test and described in the [Final Report](#) have shed light on the causes for large platform sensitivity and code shortcomings have been addressed to reduce the dependency of the forecasts on platform in future HWRF runs.

Work at DTC

1. Connect individual physics correctly
2. Test entire physics suites
3. Go beyond run/fail to diagnostics

# Priorities for testing

- Helpful to DTC to have priorities of tests (focus on operational/HFIP needs)
- Easier to test
  - Physics already in WRF framework for NMM
  - Tunable parameters within physics
- Next level of complexity
  - Physics in WRF framework for ARW
  - Requires connecting to HWRF (physics and dynamics) – not trivial
- Next level of complexity
  - Other physics (COAMPS etc.)
  - Added cost to make them available – not trivial

# Issues regarding physics testing

- **Resolution**
  - Physics can be targeted to certain resolutions; should we focus on 3 km?
  - Is model top at 50 hPa adequate?
- **Ocean**: should HWRF experiments be done with POM or HYCOM?
  - If planning 2012 HYCOM implementation, should physics tests be done with HYCOM?

# Idealized Simulations

- Important for developing and testing physics
- DTC working with J-W Bao to incorporate idealized hurricane case in community release
- Non-hurricane cases for NMM are also important

# NMM-B and NEMS

- NCEP is transitioning all its models to the NOAA Environmental Modeling Framework
- Operational hurricane model will not be WRF-based
- NMM-E will be replaced by NMM-B
- How will we transition researchers from WRF to NEMS?
  - Strive for plug-n-play packages that work on both
  - Put NMM-B in WRF??
- How much to invest in current system
  - Worth to add advection of microphysical species to WRF-NMM, since it is already working in NMM-B?

# Evaluation and Verification at DTC

- Current Activities
  - Performs Reference Configuration and other testing
  - Engaged in diagnostic activities
  - Started development of Hurricane Evaluation Toolkit
- Possible future activities
  - Maintain archive of benchmarked case studies
  - Conduct non-traditional verification (object-based etc.)
  - Develop Diagnostic toolkit

# How can the DTC best serve the community (R and O)?

- Feedback is welcome on testing, code management, user support etc.
