

HAFS Moving Nest and Physics Development, Tests & Evaluations at AOML

X. ZHANG¹, A. HAZELTON^{1,2}, W. RAMSTROM^{1,2}, G. ALAKA, JR.¹, H. CHEN^{1,2}, R. ST. FLEUR^{1,2}, M.-C. KO^{1,2}, L. GRAMMER^{1,2}
S. GOPALAKRISHNAN¹, AND F. D. MARKS, JR.¹ (¹AOML/HRD & ²UM/CIMAS)

COLLABORATORS:

A. MEHRA AND HURRICANE PROJECT TEAM (NCEP/EMC)

L. HARRIS AND WEATHER & CLIMATE DYNAMICS DIVISION (GFDL)

HAFS Activities at AOML

2

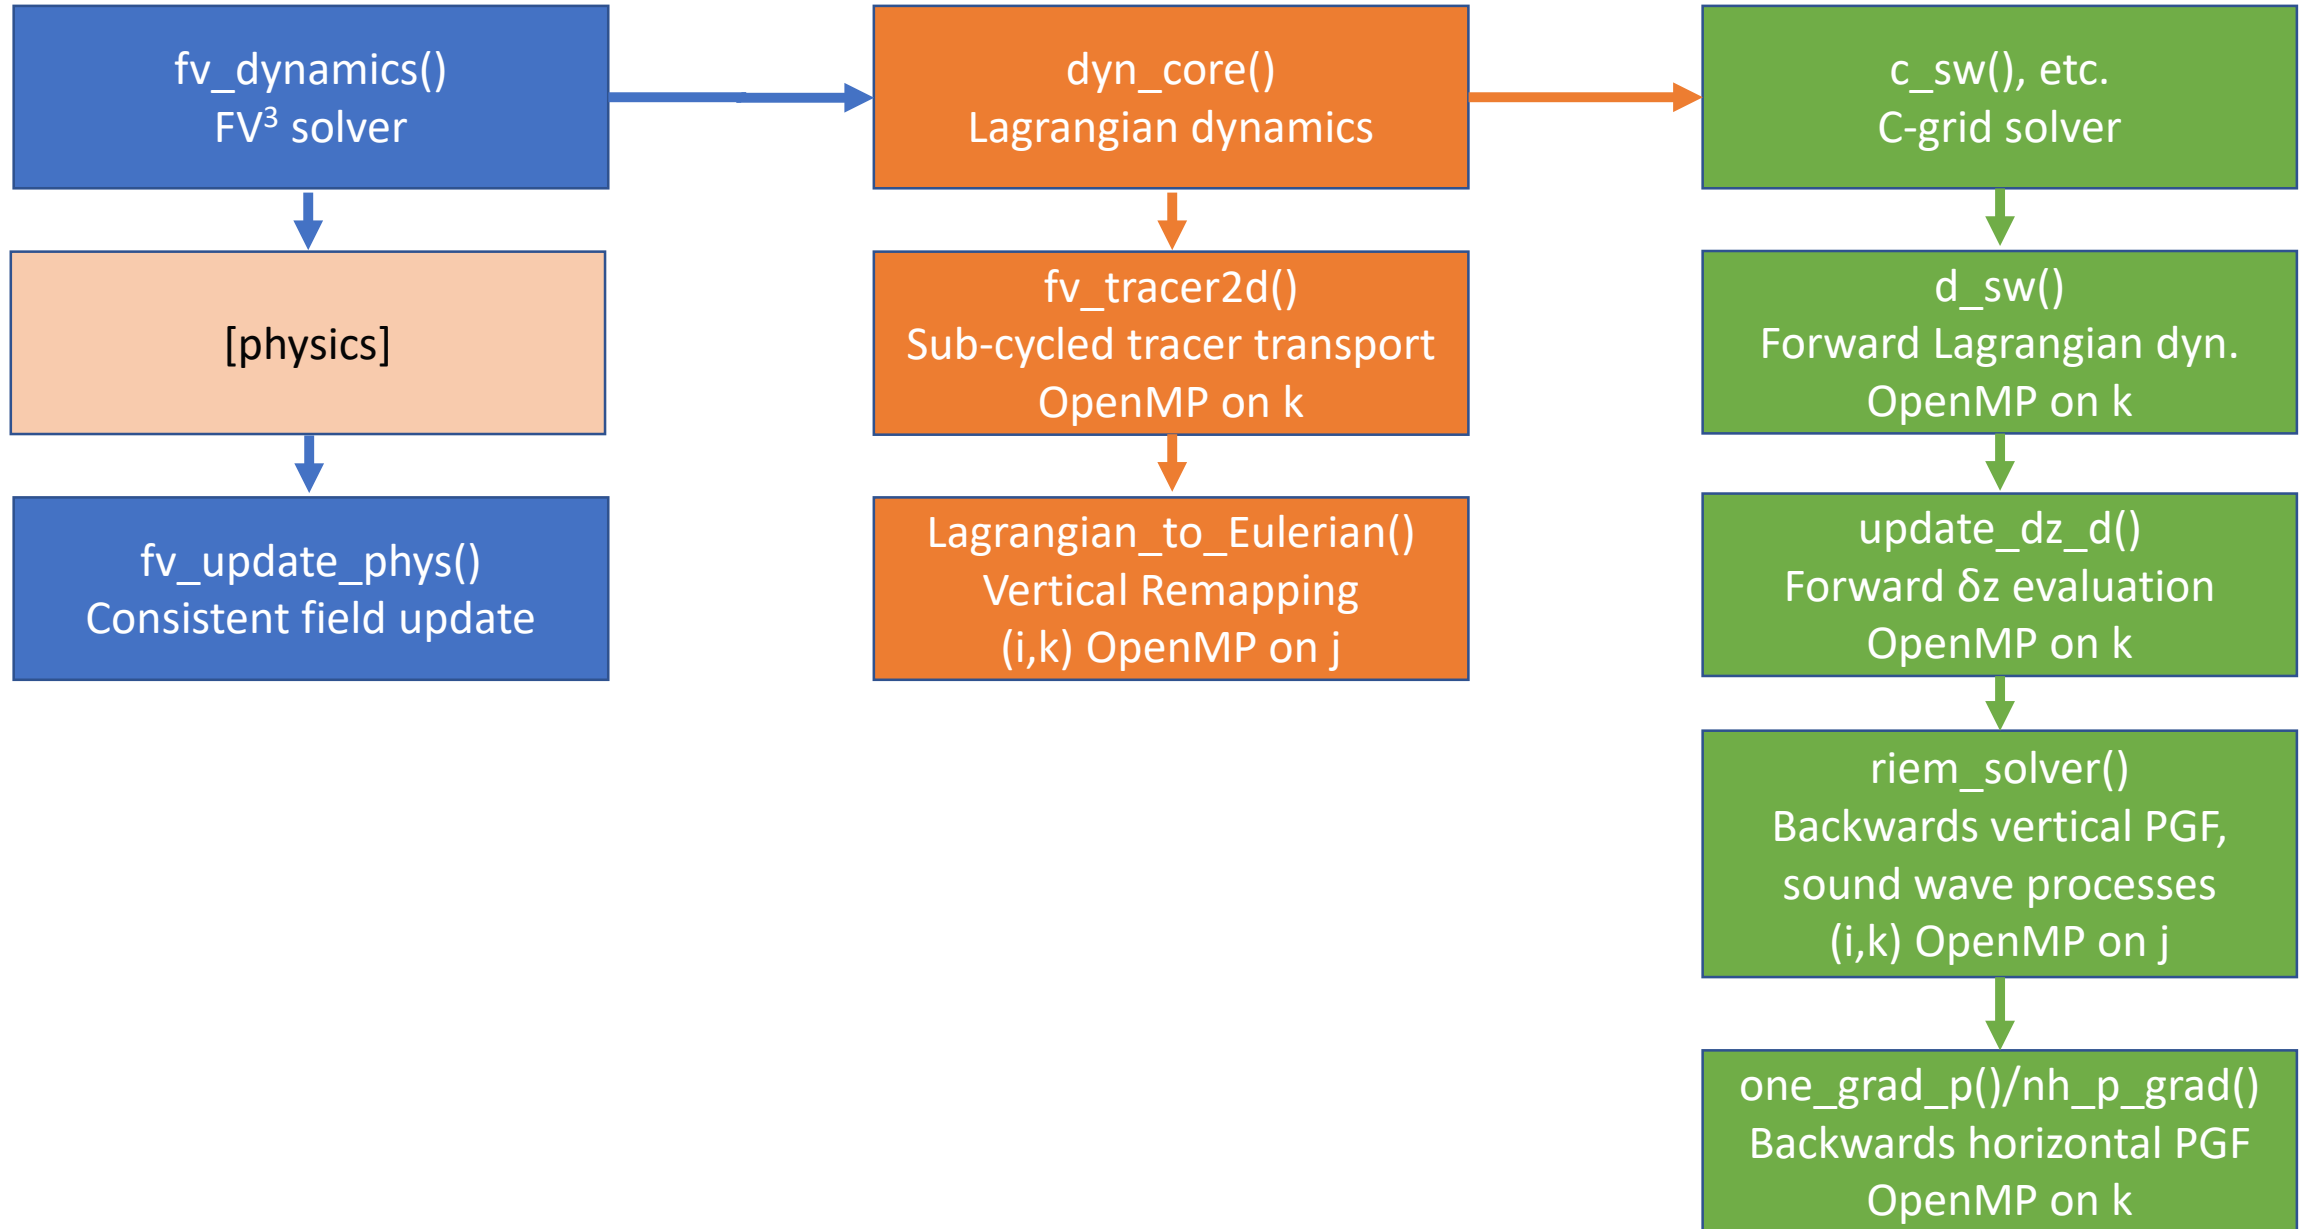

- Moving nest
 - Model infrastructure changes
 - Moving nest testing with the infrastructure
 - Moving nest in dynamic core
 - Configuration without physics for moving nest
 - Moving nest implementation with physics
 - Workflow for moving nest
- HAFS physics development and evaluation
 - Transitioned developments from the IPD version to CCPP
 - Added several diagnostic output variables related to PBL evaluation including K_m , TKE, and mixing length
 - Performing evaluations of EDMF-TKE through comparison with observations
 - Continuing development of research and forecast products
- HPC resource issues
 - UFS release code transitioned and tested on Orion
 - Data availability issue on Orion
- Publications and presentations related to HAFS
 - Publications (HAFS 0.B submitted to WAF)

“remapping” loop

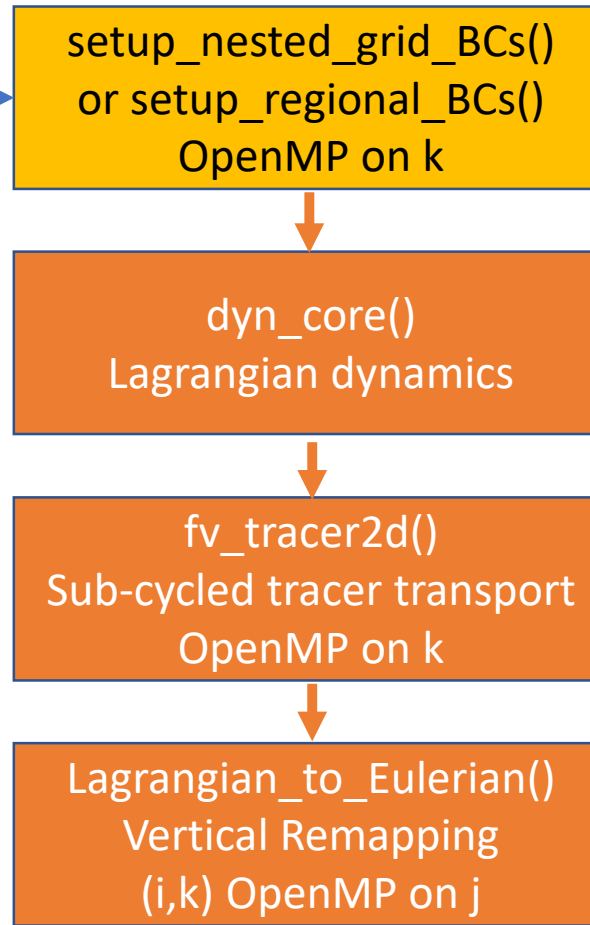

n_split
“acoustic” loop

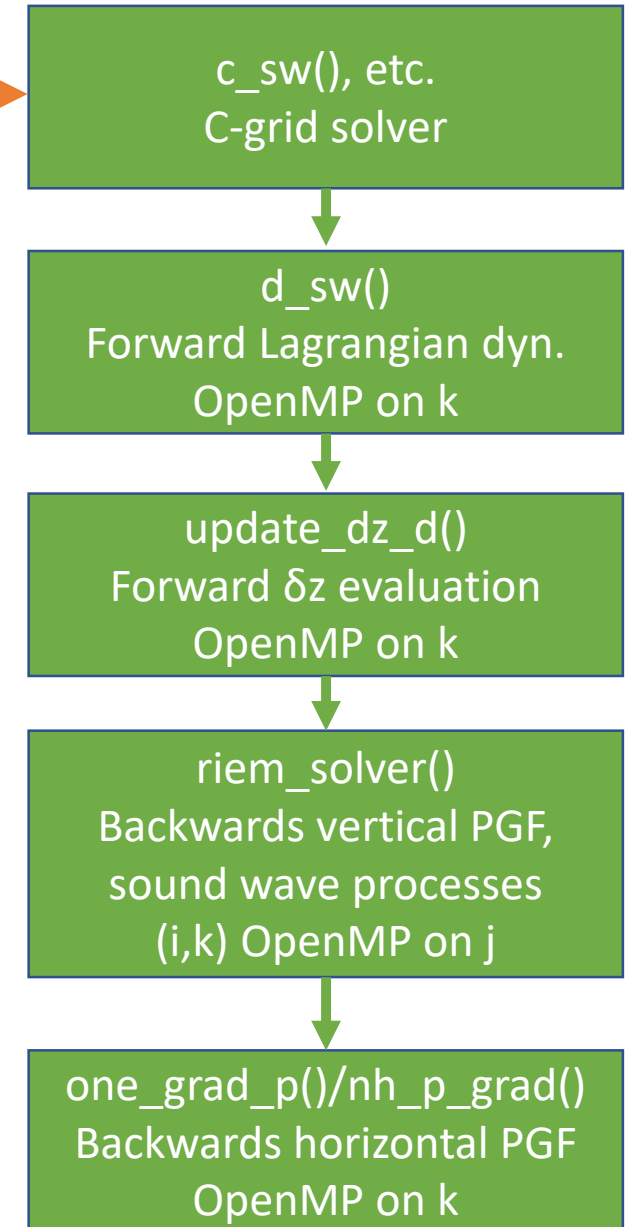

dt_atmos

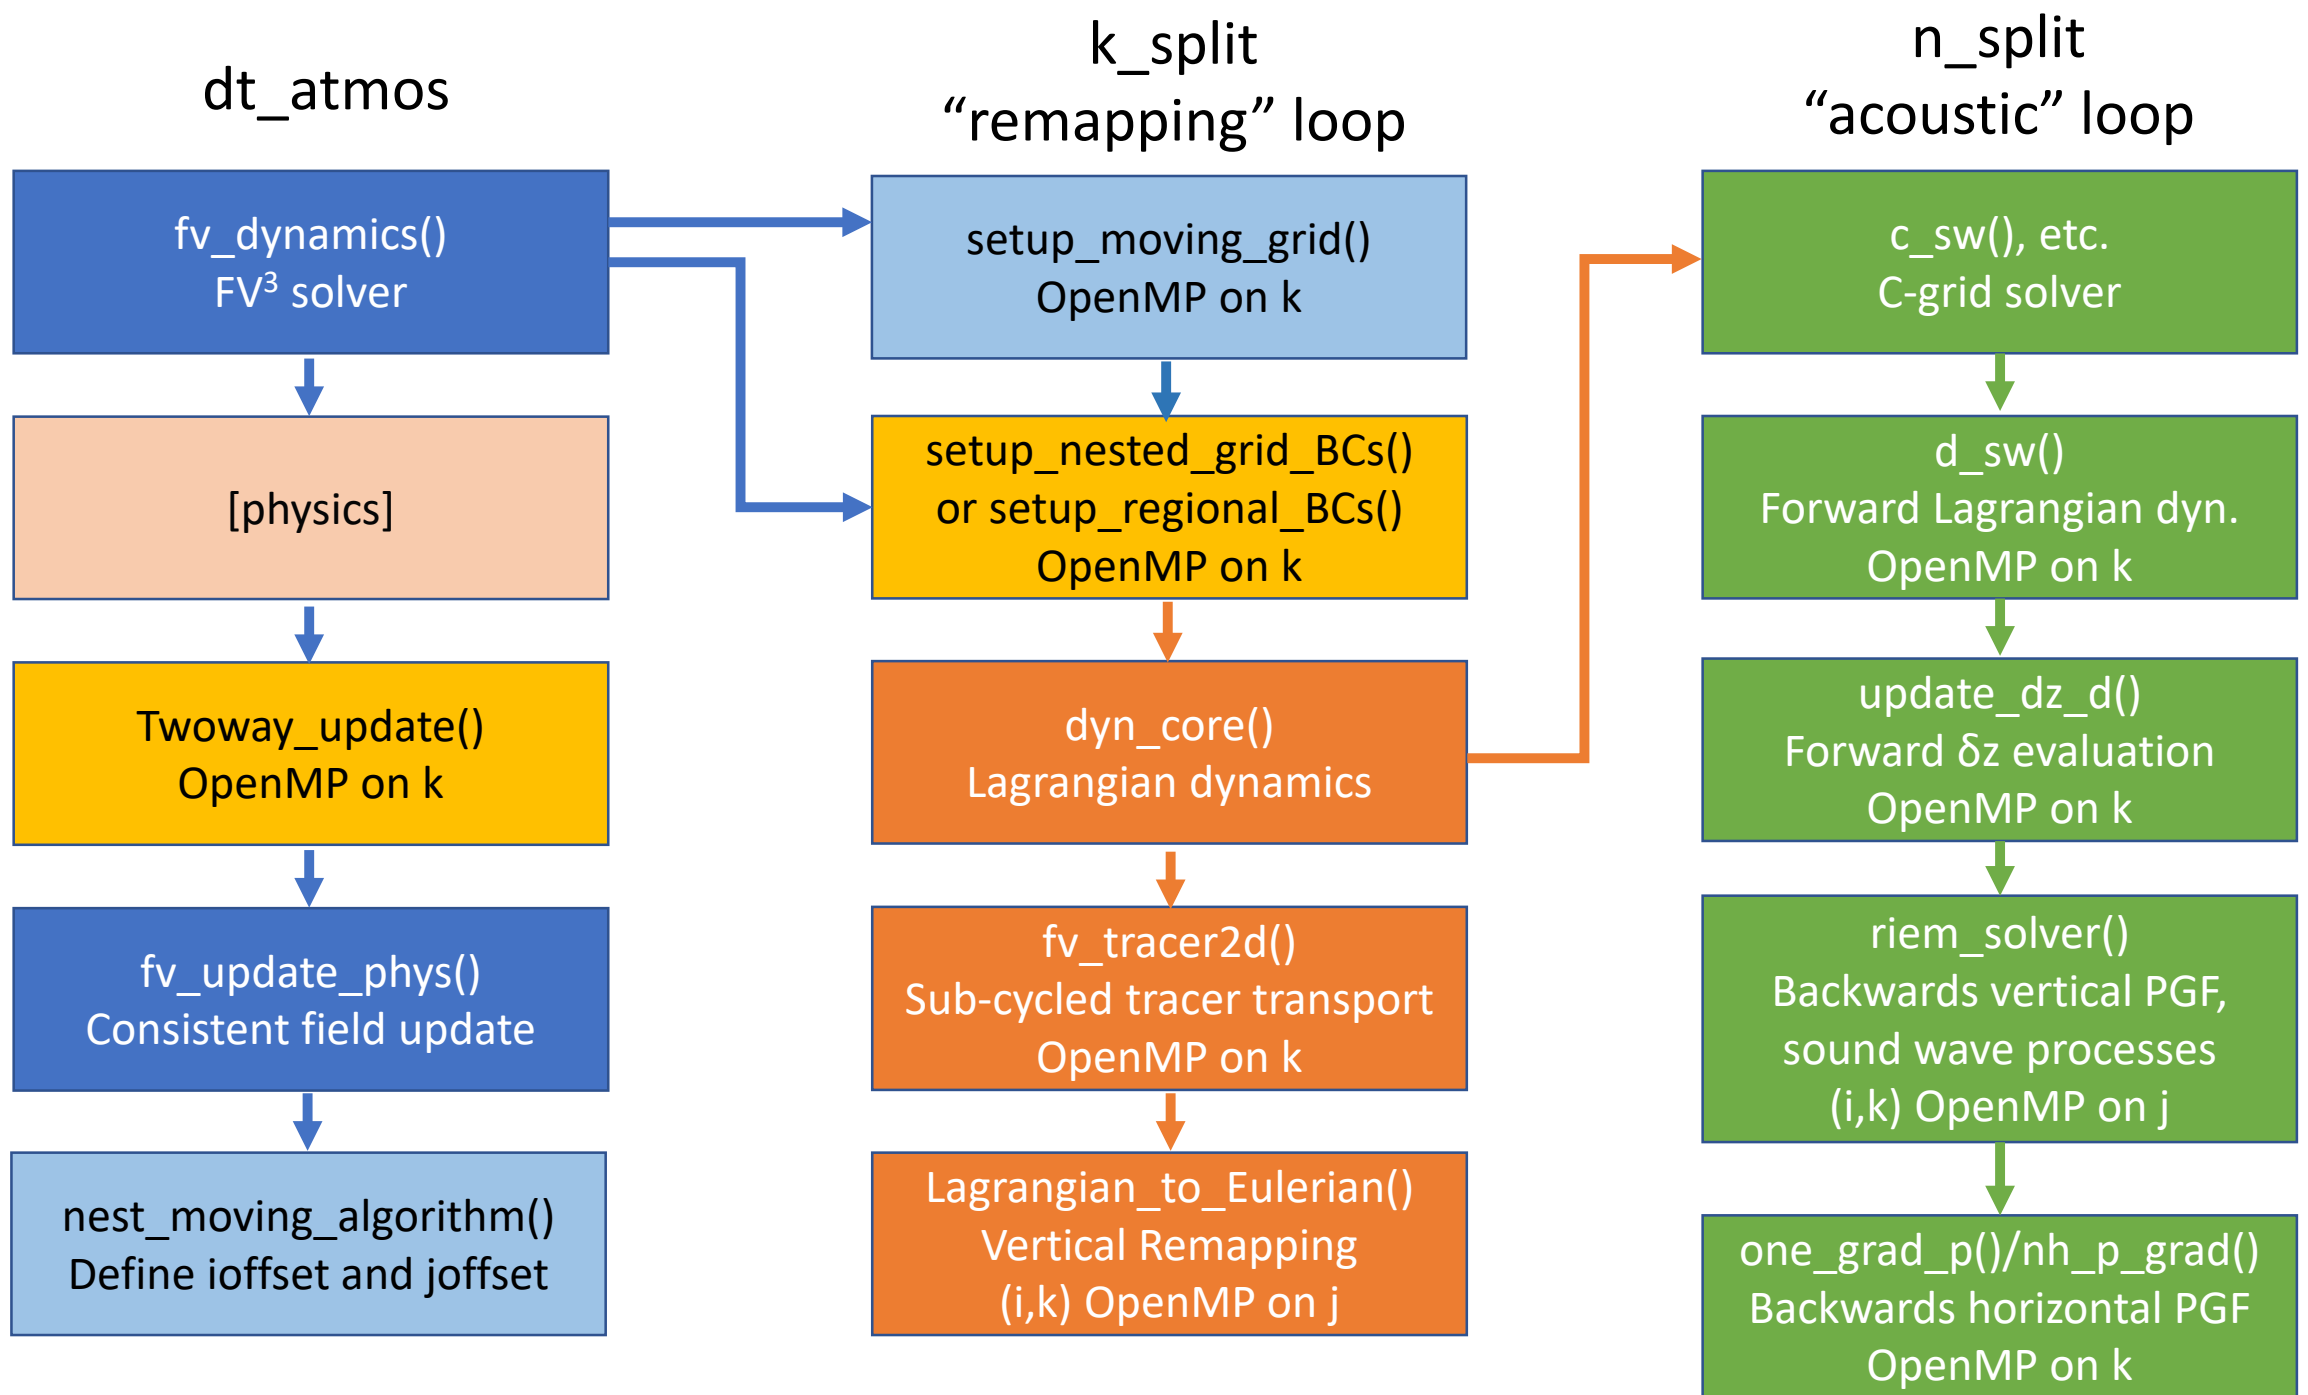

k_split “remapping” loop

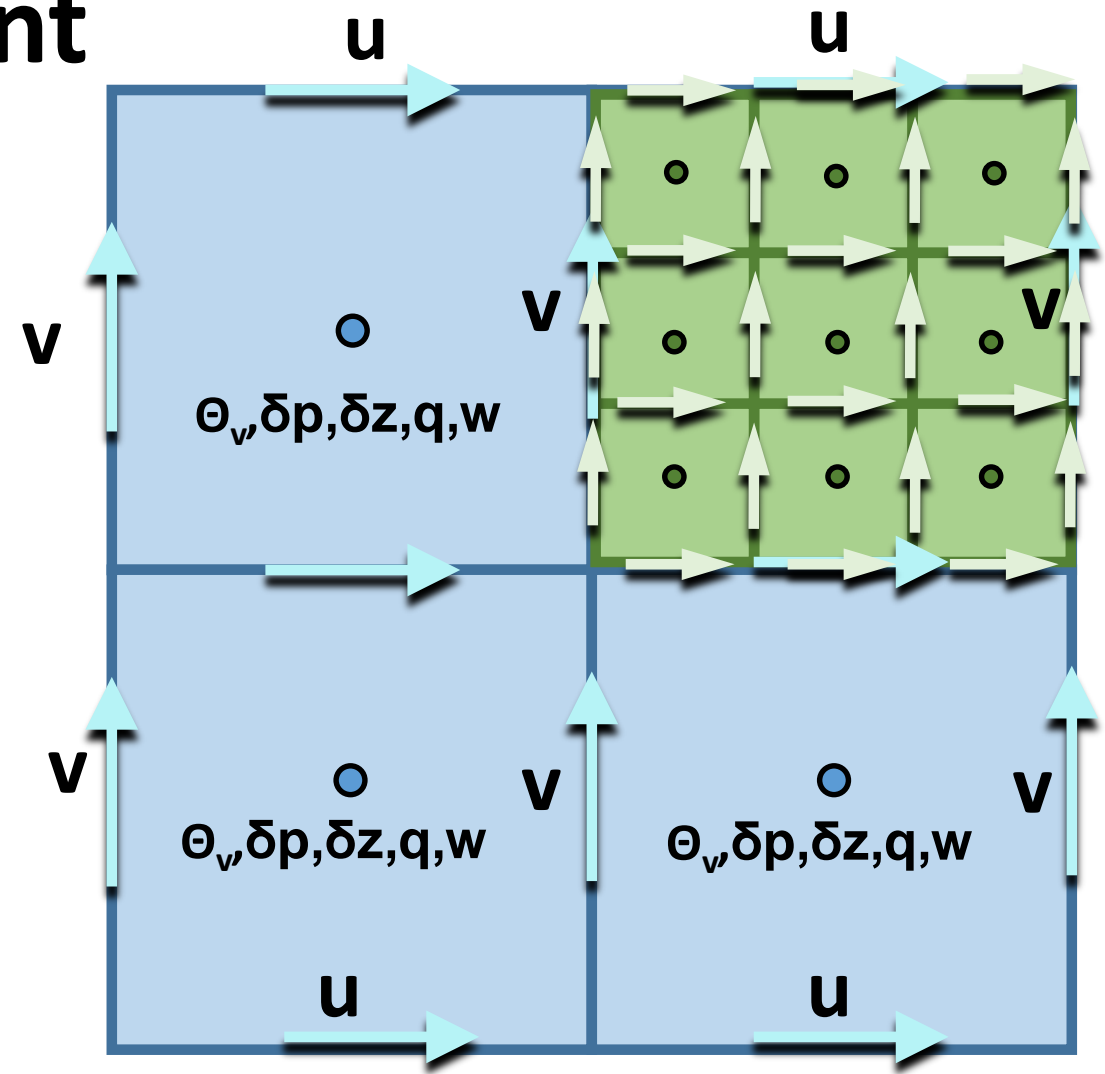

n_split “acoustic” loop

Moving Nest Development

- Moving nest interpolation routines
 - Split code into `fv_moving_nest.F90` and test driver modules
 - Stress test with more difficult values
- Identified dycore prognostic variables
- Subroutines in file `fv_moving_nest.F90`
- Handles Arakawa A and D grid staggers
- Work with Xuejin Zhang to insert moving nest code into dycore
- Attempt to turn off model physics for first tests

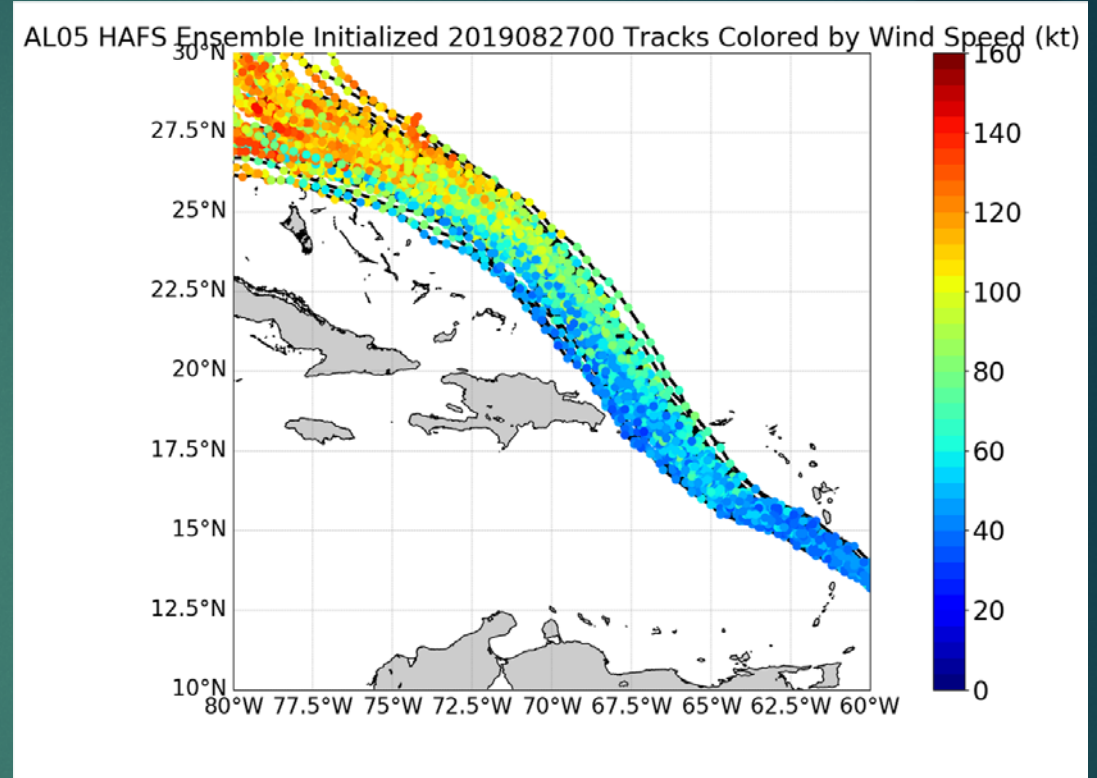

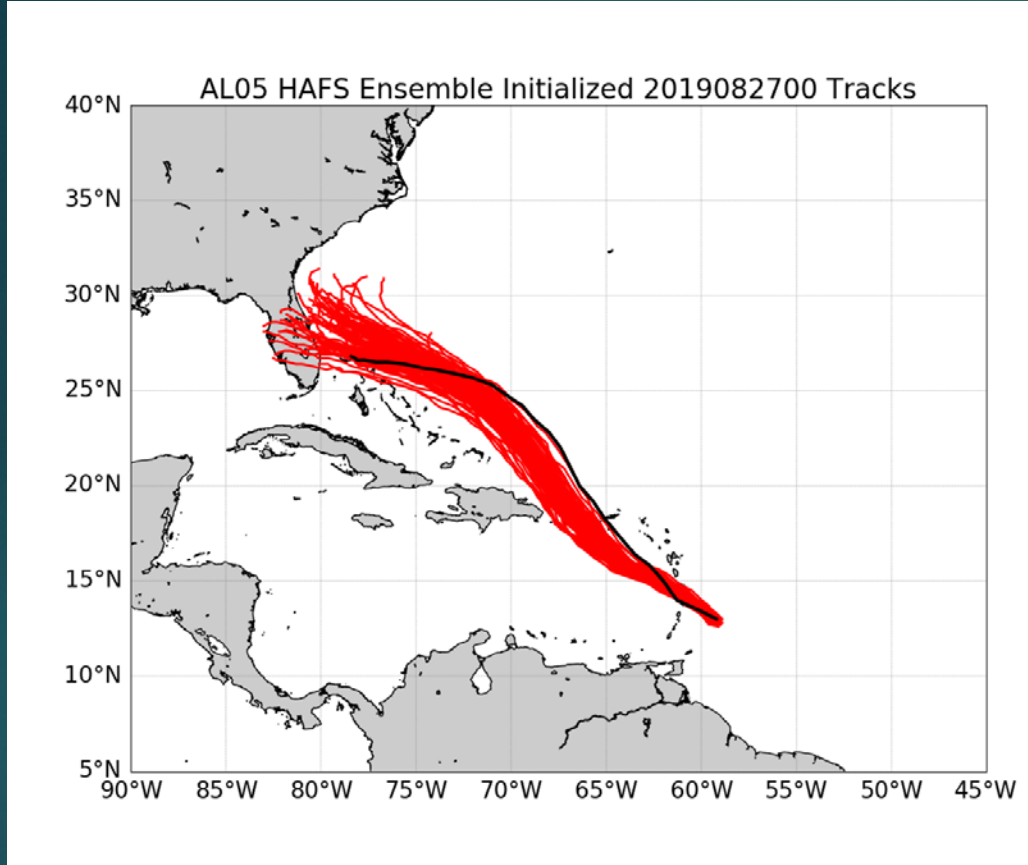

FV3 Prognostic Variable Staggering (Non-hydrostatic)

Integration with HAFS Workflow

- C96 for testing
 - 4x refinement nest
- Python script to generate/validate nest bounds, processor layouts
- Want to enable output of raw parent tiles and nest tile

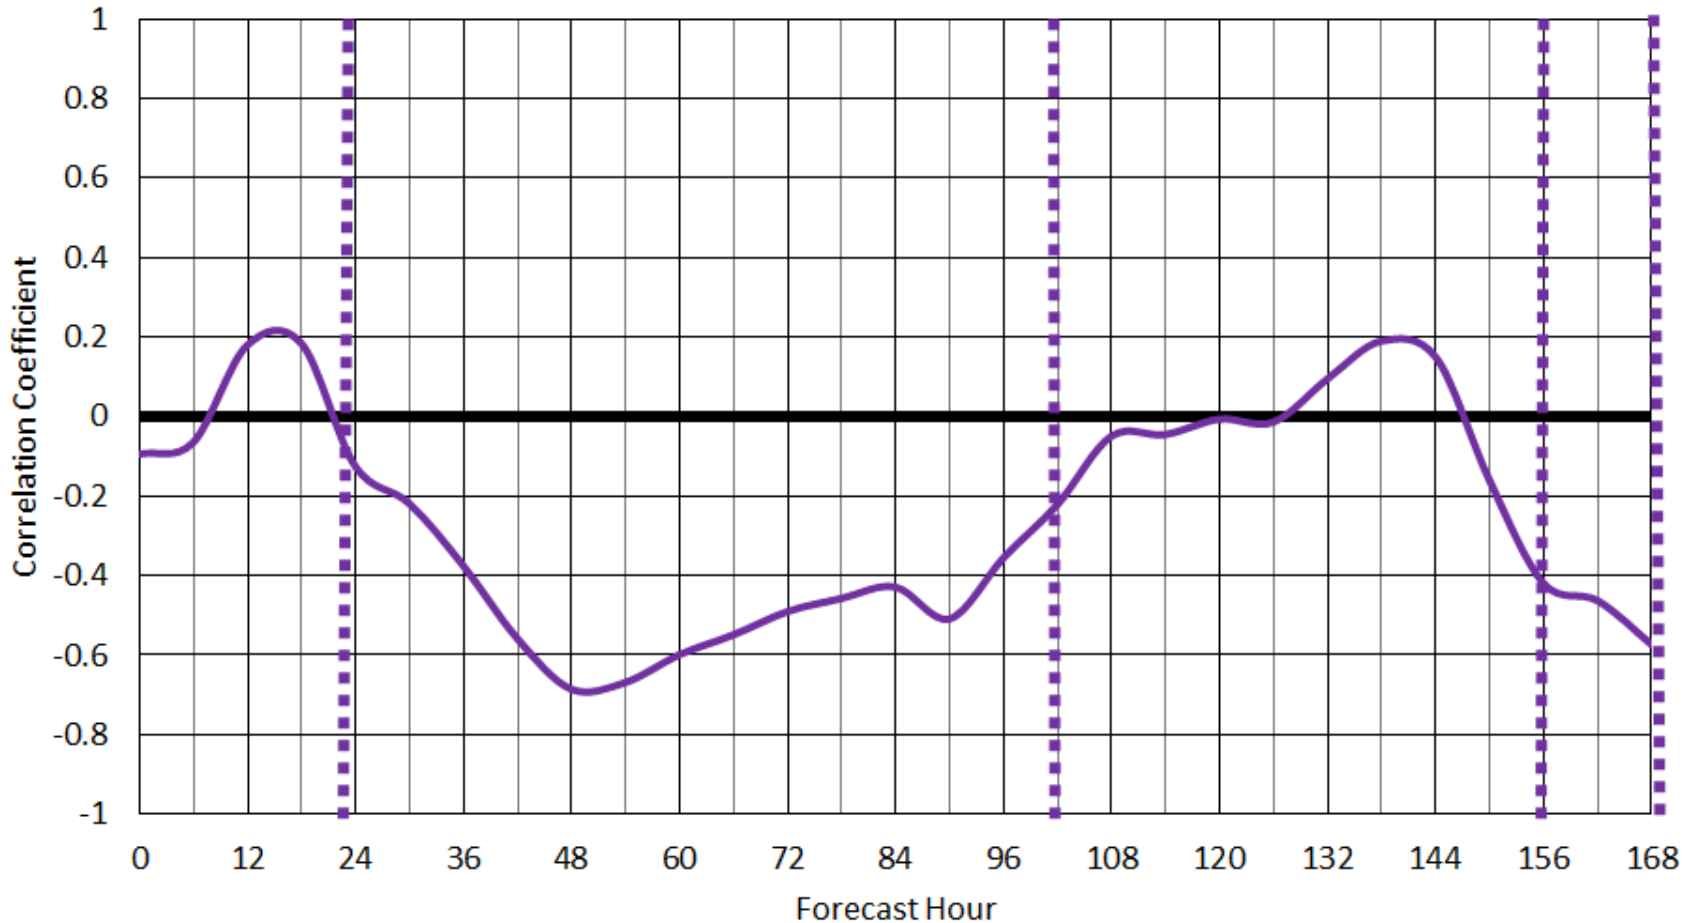

Dorian Ensemble Initialized 2019082700

- Ensemble Set was fairly dispersive in track
- Observed track was still outside this set for a time
- Track and intensity related early

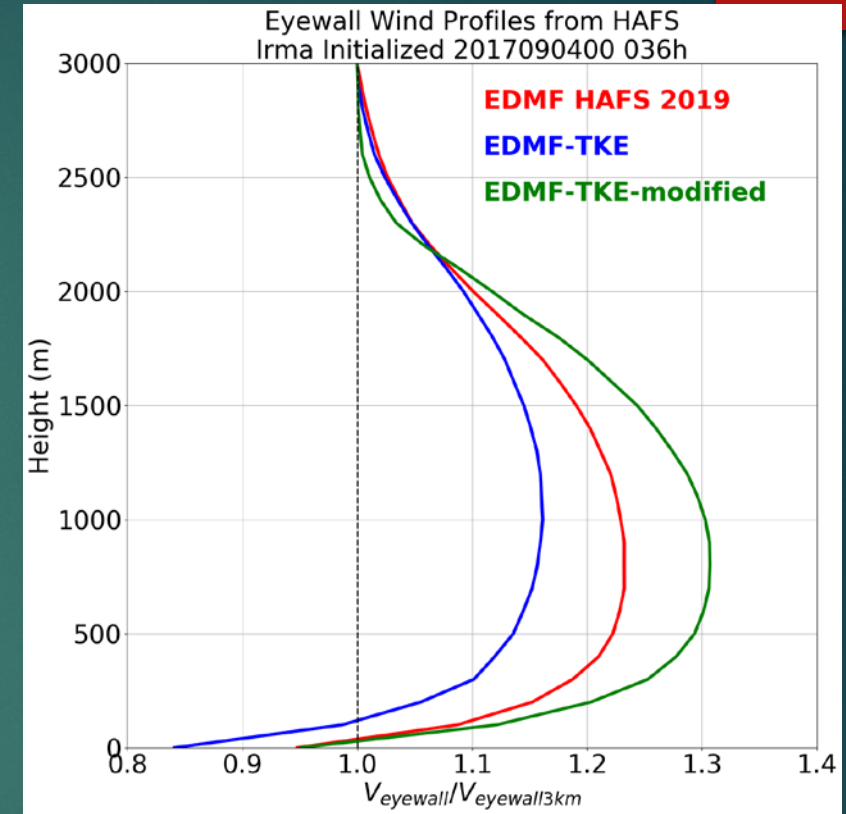

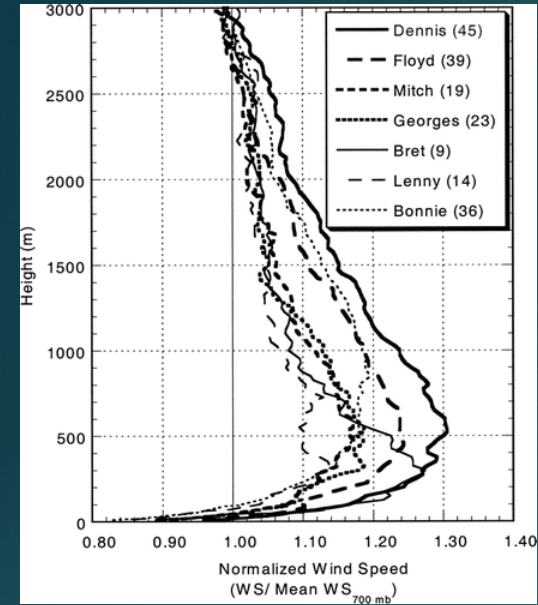

Correlation of Track and Intensity Error at

Correlation of Track and Intensity Errors at Each Forecast Hour

- Two periods where track and intensity are related:
 - ← Early period associated with center reformation, track near Antilles
 - ← Late period near possible landfall
- In the 102-156 hour range there is little relationship

PBL Wind Profile

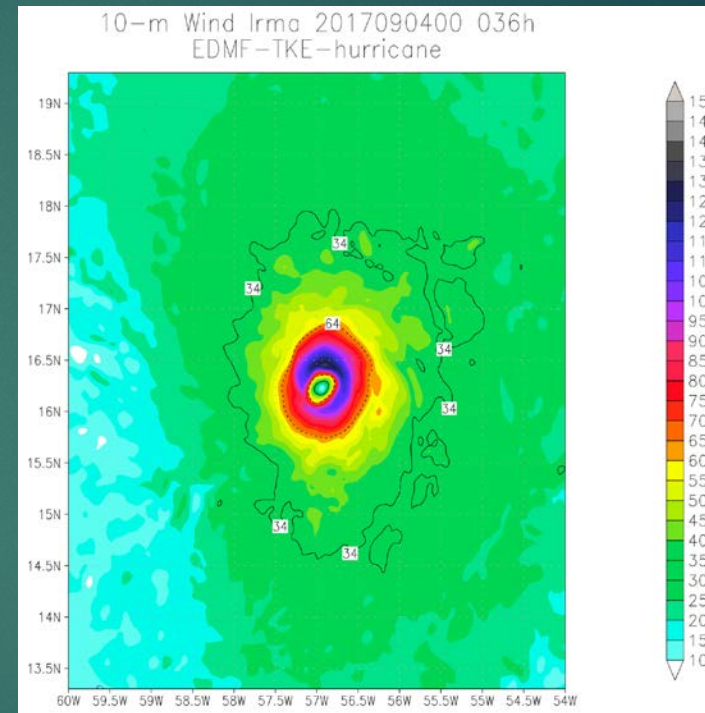

- ↵ Variability seen between forecast hours (similar to observational variability)
- ↵ EDMF-TKE seems to have too broad of a peak compared to obs and also compared to current HAFS EDMF scheme

Structure With Modifications to K/L

EDMF-TKE

EDMF-TKE

- ↵ Intensity difference is apparent
- ↵ Smaller RMW with PBL modifications
- ↵ Mean R34 was 118 n mi in modified, 134 n mi in original (Best Track: 115 n mi)

HPC Resources

12

- ❑ Resource allocated on Hera
- ❑ Model code transition to Orion underway (Global version worked)
- ❑ Porting of post-processing and graphics underway
- ❑ Data availability on Orion is an issue

Publications and Presentations
